

MA and FMA Full Specimen Exam Answers

Question	Correct answer	Marks															
1	Functional benchmarking The company is using functional benchmarking as it is comparing an internal function to a similar function in another company, even though the two companies operate in different industry sectors.	2															
2	Setting a cost by subtracting a desired profit margin from a competitive market price Target costing is when a cost is determined by subtracting a desired profit margin from a competitive market price.	2															
3	Process F – Abnormal loss Process G – Abnormal gain <table><tr><td>Process</td><td>Normal loss as % of input</td><td>Input (litres)</td><td>Expected output</td><td>Actual output</td></tr><tr><td>F</td><td>8</td><td>65,000</td><td>92% x 65,000 = 59,800</td><td>58,900</td></tr><tr><td>G</td><td>5</td><td>37,500</td><td>95% x 37,500 = 35,625</td><td>35,700</td></tr></table> Process F: abnormal loss of 900 litres (58,900 - 59,800) Process G: abnormal gain of 75 litres (35,700 - 35,625)	Process	Normal loss as % of input	Input (litres)	Expected output	Actual output	F	8	65,000	92% x 65,000 = 59,800	58,900	G	5	37,500	95% x 37,500 = 35,625	35,700	2
Process	Normal loss as % of input	Input (litres)	Expected output	Actual output													
F	8	65,000	92% x 65,000 = 59,800	58,900													
G	5	37,500	95% x 37,500 = 35,625	35,700													
4	27000 As production volume is greater than sales volume, there is a closing inventory of 2,000 units (14,000 - 12,000). When inventory increases, profit under absorption costing is higher than profit under marginal costing. Difference in profit = change in inventory x overhead absorption rate (OAR) per unit = 2,000 units x (\$63,000/14,000 units) = \$9,000 Profit under marginal costing = \$36,000 - \$9,000 = \$27,000	2															
5	Differences in workforce motivation The differences in workforce motivation should not be allowed for, as the motivation of the workforce cannot be measured in an objective way to compare the efficiency of the management of the two organisations.	2															

6	Random sampling Random sampling is when each member of the target population has an equal probability of being chosen.	2
7	147000 Production budget = sales + closing inventory - opening inventory $= 19,000 + 3,000 - 4,000$ $= 18,000 \text{ units}$ Material usage budget = production units x material usage per unit $= 18,000 \times 8\text{kg per unit}$ $= 144,000 \text{ kg}$ Material purchases budget = usage + closing inventory - opening inventory $= 144,000 + 53,000 - 50,000$ $= 147,000\text{kg}$	2
8	 Raw material costs are costs which change with activity, so the line has to start at the origin of the graph. As there is a fall in price per unit the line has to have a vertical drop part way through. The correct graph is Graph 4, as the line after the fall in price would also go through the origin if it is extrapolated, which shows the cost is variable and will increase proportionately with activity.	2
9	It helps coordinate the activities of different departments It establishes a system of control Budgets help to co-ordinate the activities of different departments and are also used by organisations as a system of control. They are not a legal reporting requirement and are a way for strategic objectives to be translated into tactical and operational goals, rather than a starting point for strategic planning.	2
10	2 only When junior management participate in setting budgets, they feel they have more ownership of the	2

	budget and are therefore more motivated to achieve the budget.	
11	30 Residual income = operating profit - (imputed interest x capital employed) \$36,000 = operating profit - (12% x \$200,000) Operating profit = \$36,000 + \$24,000 = \$60,000 Return on investment = operating profit/capital employed x 100 = \$60,000/\$200,000 x 100 = 30%	2
12	An increase in direct material prices An increase in raw material usage per unit An increase in the direct material price and an increase in the raw material usage per unit would be possible causes for the adverse direct material variance.	2
13	\$130,000 The difference between the fixed budget profit and the standard profit on actual sales is the sales volume variance. Fixed budget profit = standard profit on actual sales + sales volume variance = \$120, 000 + \$10,000 = \$130,000	2
14	1 and 2 Return on investment and market share are suitable strategic performance measures. The number of customer complaints would be more of an operational performance indicator.	2
15	0 - 0.94 0 and -0.94 are correct as the correlation coefficient lies between the values of -1 and +1.	2
16	Sales volume variance The sales volume variance would change as under marginal costing it is valued at standard contribution, whereas under absorption costing it is valued at standard profit.	2
17	13680 Using the high-low method; Variable cost per unit = (\$15,120 - \$11,280)/(10,000 - 6,000) = \$0.96	2

	<p>Fixed costs at the highest output level = \$15,120 - (\$0.96 x 10,000 units) = \$5,520</p> <p>At 85% capacity, the budgeted total production cost will be = \$5,520 + (\$0.96 x 8,500 units) = \$13,680</p>															
18	<p>12.5%</p> <p>The IRR of a project is equal to the cost of capital which would give a NPV of \$0. At 10% the NPV is \$50; at 11% the NPV would fall to \$30; at 12% the NPV would fall to \$10, therefore at 12.5% the NPV would fall to \$0. 12.5% is the IRR of the project.</p>	2														
19	<p>\$128,500</p> <table><tr><td></td><td>Production Cost</td></tr><tr><td></td><td>Centre P</td></tr><tr><td>Allocated and apportioned</td><td>\$95,000</td></tr><tr><td>Re-apportionment of Y (30% x \$30,000)</td><td>\$9,000</td></tr><tr><td>Re-apportionment of X (50% x \$49,000)</td><td>\$24,500</td></tr><tr><td></td><td><hr/></td></tr><tr><td></td><td>\$128,500</td></tr></table> <p>Note: X's overheads includes 10% re-apportionment of Y's costs (\$3,000)</p>		Production Cost		Centre P	Allocated and apportioned	\$95,000	Re-apportionment of Y (30% x \$30,000)	\$9,000	Re-apportionment of X (50% x \$49,000)	\$24,500		<hr/>		\$128,500	2
	Production Cost															
	Centre P															
Allocated and apportioned	\$95,000															
Re-apportionment of Y (30% x \$30,000)	\$9,000															
Re-apportionment of X (50% x \$49,000)	\$24,500															
	<hr/>															
	\$128,500															
20	<p>\$220</p> <p>With a selling price of \$672 and a net profit mark-up of 20%, the total cost is (\$672/1.2) = \$560. The fixed overhead cost is \$340, therefore the variable cost = \$560 - \$340 = \$220.</p>	2														
21	<p>It restricts the performance of an organisation for a given period</p> <p>It affects the order in which an organisation prepares its budgets</p> <p>The principal budget factor is the factor which restricts the company from making maximum profits. In many cases this will be sales, but it could be another limiting factor. When preparing budgets, the principal budget factor is the starting point and all budgets will flow from it.</p>	2														
22	<p>\$39,200</p> <p>\$40,000 + \$900 - \$1,000 + \$700 - \$500 - \$900 = \$39,200</p>	2														
23	<p>It helps to better understand customer behaviour and preferences – True</p> <p>It helps to analyse the efficiency of business</p>	2														

	<p>processes in real time – True</p> <p>Big data analytics allow organisations to process large volumes of data from numerous internal and external sources. This will allow an organisation to gain detailed insights into its customer behaviour and their preferences and also allow it to analyse how efficient its internal processes are.</p>

26	<div>1 and 2 only</div> <div>The advantages of linear regression analysis over the high-low method are that the reliability of the analysis can be statistically tested and that it takes into account all of the data.</div>	2																																			

27	<p>Use of bar coding and scanning equipment Completion of timesheets by employees</p> <p>The use of bar coding and scanners and the completion of time sheets are examples of direct data capture costs because they are costs involved in capturing the data for the first time.</p> <p>Time spent by the payroll department processing employee costs and finance staff preparing a monthly sales report are not direct data capture but are examples of processing costs.</p>	2
28	<p>Quantified short term targets the organisation seeks to achieve</p> <p>An organisation's mission statement will usually follow its long-term aims. It will includes its values and beliefs, its products and services, how it wants to compete and its commitments to its major stakeholders.</p> <p>Quantified, short-term targets are usually included in an organisation's budget.</p>	2
29	<p>180</p> <p>Standard time for actual output of 200 units = 200 units x 3 minutes per unit = 600 minutes or 10 hours Gross pay = 10 hours x \$18 = \$180</p>	2
30	<p>Under absorbed by \$3,875</p> <p>Absorbed overhead (actual hours x OAR) = 30,000 x \$3.50 \$105,000</p> <p>Actual overhead \$108,875</p> <p>Under absorption \$3,875</p>	2
31	<p>No strict rules govern the way in which the information is presented</p> <p>It may be presented in monetary or non-monetary terms</p>	2

	<p>Management information does not have to be presented in a set format; it is usually presented in a manner suitable to the organisation concerned.</p> <p>Management information can be both financial and non-financial.</p>	
32	<p>61 degrees</p> <p>The angle of the section of the pie chart representing Market 3 = $\\$51,000/\\$300,000 \times 360 \text{ degrees} = 61 \text{ degrees}$</p>	2
33	<p>A purchase order</p> <p>Purchase orders produce transactional data. Social/human data includes all types of social media posts, tweets, videos and blog posts. It is mostly non-numerical and can be difficult to analyse. The output from a fitness tracker and a GPS vehicle tracking system would be classified as machine (sensor) data sources.</p>	2
34	<p>1461</p> <p>$EOQ = \sqrt{(2 \times 20 \times 80,000)/(25 \times 0.06)} = 1,461$</p>	2
35	<p>2.28%</p> <p>$Z\text{-score} = (x - \mu)/\sigma$</p> <p>Therefore: $(80 - 56)/12 = 2$</p> <p>From the normal distribution table, 2 = 0.4772</p> <p>To find the probability of scoring more than 80: $0.5 - 0.4772 = 0.0228$ or 2.28% as a %.</p>	2

MTQ 36

Task 1 (5 marks)

Computerised tracking system investment of \$2,100,000	<p>Relevant</p> <p>The tracking system investment is a future incremental cash flow arising as a result of the</p>
--	---

	project, so is relevant.
Depreciation of \$420,000 in each of the five years	Irrelevant Depreciation is a notional cost i.e. a non-cash item so is not relevant
Staff training costs of \$425,000	Relevant Staff training costs of \$425,000 are a future incremental cash flow and so are relevant
New staff total salary of \$120,000 per annum	Relevant Staff salary costs of \$120,000 are relevant as they are for new staff recruited specifically for the project.
Staff training costs of \$75,000	Irrelevant Staff training costs of \$75,000 have already been spent and so are a sunk cost. They are not relevant to whether the project goes ahead.
Interest cost of \$150,000 per annum	Irrelevant Interest cost of \$150,000 is not relevant. The NPV is discounted at the company's cost of capital which accounts for the return required by the company's providers of finance, which would include debt providers.

Task 2 (3 marks)

Incremental sales in Year 1	800000
-----------------------------	---------------

	With investment = \$11 million Without investment = <u>\$10.2 million</u> Incremental sales = \$800,000
Savings in vehicle running costs in Year 1	110000 $\$11\text{million} \times 1\% = \$110,000$
Present value of the maintenance costs over the life of the contract	Answer range: 284000 – 285000 $\$75,000 \times \text{annuity factor at } 10\% \text{ for five years}$ $\$75,000 \times 3.791 = \$284,325$

Task 3 (2 marks)

The project is worthwhile because the IRR is greater than the cost of capital

As the project's IRR is 14%, which is greater than the company's cost of capital of 10%, then the project is worth investing in.

As the IRR represents a cost of capital which would give an NPV of zero on the project, then a cost of capital lower than the IRR would generate a positive NPV and increase shareholder wealth, showing that the project is worthwhile.

MTQ 37**Task 1 (2 marks)**

$=(C9 \times C4) - (150,000 \times 8)$
--

Direct labour efficiency variance = (standard hours for actual production - actual hours) x standard rate

$$= (26,000 \text{ hours} \times \$48) - (150,000 \times \$8)$$

$$= \text{\$48,000 F}$$

Task 2 (6 marks)

Standard cost operating statement Month 1	\$		\$	
Budgeted contribution			700,000	
Sales volume variance			16800	Fav
Standard contribution on actual sales			716800	
Sales price variance			5120	Adv
			711,680	
Cost variances				
Total direct materials variance	12,800	Adv		
Direct labour rate variance	21,000	Adv		
Direct labour efficiency variance	48,000	Fav		
Total variable production overhead variance	10,000	Fav		
			24,200	Fav
Actual contribution			735,880	

Gap 1 - The difference between budgeted contribution and standard contribution on actual sales is the sales volume variance.

Gap 2 - Sales volume variance = (budgeted sales - actual sales) x standard contribution

$$= (25,000 - 25,600) \times \$28$$

$$= \$16,800$$

Gap 3 - The sales volume variance is favourable as the actual sales are greater than the budgeted sales.

Gap 4 - Standard contribution on actual sales = budgeted contribution + sales volume variance = \$700,000 + \$16,800 F = \$716,800

Gap 5 - Sales price variance = (actual sales x budgeted selling price) - actual revenue = (25,600 x \$120) - \$3,066,880 = \$5,120

Gap 6 - The selling price variance is adverse as the actual sales units should have generated revenue of \$3,072,000 but actually sold for \$3,066,880.

Task 3 (2 marks)

Higher grade labour performed tasks more efficiently
A productivity bonus was paid to direct labour

The direct labour rate variance is adverse which indicates that labour cost more. This could have arisen due to the use of higher grade labour or paying a productivity bonus. Both of these factors could explain why the labour efficiency variance was favourable.

MTQ 38**Task 1 (6 marks)**

Return on capital employed	25 % $\text{ROCE} = (\text{profit before interest and tax} / \text{average capital employed}) \times 100 = (\$48 \text{ million} / \$192 \text{ million}) \times 100 = 25\%$
Operating profit margin	10 % $\text{Operating profit margin} = (\text{profit before interest and tax} / \text{sales revenue}) \times 100 = \$48 \text{ million} / \$480 \text{ million} = 10\%$
Asset turnover	2.5 times $\text{Asset turnover} = \text{sales revenue} / \text{average capital employed} = \$480 \text{ million} / \$192 \text{ million} = 2.5 \text{ times}$
Average wait for a telephone repair	Answer range: 29-30 days $\text{Average wait for a telephone repair} = (\text{average number of unrepaired telephones per day} / \text{average number of telephones})$

	returned for repair each year) x 365 = $(804/10,000) \times 365$ = 29 days
--	---

Task 2 (2 marks)

Percentage of customers lost per annum	6.00 % Percentage of customer lost per annum = (number of customers lost/average number of customers) x 100 = $(117,600/1,960,000) \times 100 = 6\%$
Percentage of sales attributable to new products	Answer range:

	<p>1.66-1.67 %</p> <p>Percentage of sales attributable to new products = (sales attributable to new products/sales revenue) x 100 = (\$8 million/\$480 million) = 1.67%</p>
--	--

Task 3 (2 marks)

A balanced scorecard measures performance from four perspectives: customer, innovation and learning, financial and	<p>internal business process</p> <p>The four perspectives of the balanced scorecard are: financial, customer, internal business process and innovation and learning.</p>
The scorecard is balanced in that it requires managers to	<p>deliver performance in all four areas</p> <p>The scorecard is balanced in that it requires managers to focus performance in all four areas.</p>
